Laser Shutter Systems
SR470 Series — Laser shutters and controllers

Introducing two new optical shutter systems from SRS — the SR470 Laser Shutter Controller and SR474 Four-Channel Laser Shutter Driver. These shutter systems are designed specifically to minimize vibration on your optical table.

They are built around a unique shutter head design, supported by one of two available controller models. The SR470 provides timing signals to a single shutter head, while the multi-channel SR474 drives up to four shutter heads, and is controlled by external timing signals.

The Shutter Head

Unlike conventional solenoid based shutters, the SR475 shutter head contains a closed-loop DSP control system that precisely guides the shutter blade between open and closed positions, never encountering physical stops. Vibration and mechanical noise are kept to a minimum, leaving your optical table disturbance-free.

The shutter blade is mounted between sapphire jewel bearings that minimize friction and result in a head lifetime in excess of 10 million cycles.

SR470 Series Shutter Systems

- Ultra-low vibration shutter head
- True mechanical laser beam blocking
- >10 M cycle lifetime
- Microprocessor controlled timing
- DC to 100 Hz
- Easy to align 3 mm aperture
- GPIB, RS-232 and Ethernet

- SR470 Controller ... $1595 (U.S. list)
- SR474 Controller ... $1595 (U.S. list)
- SR475 Shutter Head ... $750 (U.S. list)
SR470 Series Laser Shutter Systems

of 10 M cycles — orders of magnitude more than is typically found in shutter heads.

The 3 mm clear aperture is designed for easy alignment and is large enough to be used with common light sources. Typical rise and fall times are under 500 µs, and repetition rates from DC to 100 Hz can be used. Unlike other shutters, the SRS shutter is not duty cycle limited — you can run any duty cycle you choose.

SR470 Controller

The SR470 Shutter Controller allows you to generate timing signals for the shutter head. You have complete control of the exposure time, which can be set between 4 ms and 10,000 s with 0.1 ms resolution. Pre- and post-exposure delays can also be configured. A bright green 8-digit LED display shows the current parameter in seconds or hertz, and timing is accurate to 100 ppm.

A variety of trigger modes are provided — internal, external, front panel, and continuous — giving you the flexibility to handle just about any application. Triggered bursts from milliseconds to months can also be generated, placing the SR470 in a class of its own.

In addition to triggered sequences, the SR470 can also act as a driver to actuate the shutter head from your own timing signals. You can also manually control the shutter from the front panel.

Remote operation is supported with GPIB, RS-232 and Ethernet computer interfaces. All instrument functions can be controlled and read over any of the interfaces. Up to nine complete instrument configurations can be saved in non-volatile RAM and recalled at any time. Shutter faults are automatically detected and reported with audible and electronic (TTL) alarms.

SR474 Four-Channel Driver

The SR474 Four-Channel Driver interfaces with up to four shutter heads. Rear-panel TTL level inputs are provided for your external timing signals. Each of the four channels can be set for normally open or normally closed operation.

Each channel has a front-panel State button which allows you to manually change the shutter state. The channel Source buttons set each channel to manual, external TTL or remote state control. Each channel also has an Align button that drives its shutter head at a 1 Hz rate making laser alignment simple. The Global Control section of the front-panel allow you to set or reset all channels to their “normal” states.

As with the SR470, remote operation is supported with GPIB, RS-232 and Ethernet computer interfaces. All instrument functions can be controlled and read over any of the interfaces. Shutter faults are automatically detected and result in audible, visible and electronic alarms.

Performance and Reliability

The SR470 and SR470 Laser Shutter systems from SRS offer performance and reliability not found in other systems. For more details call us at 408-744-9040.
**SR470 Series Specifications**

### SR475 Laser Shutter Head

**Mechanical**
- **Shutter blade**: BeCu alloy, black oxide finish
- **Clear aperture**: 0.120 in. min. diameter
- **Repetition rate**: 100 Hz
- **Exposure rise/fall time**: 500 µs typ., in full-speed
- **Min. exposure time**: 5 ms
- **Insertion delay jitter**: 10 µs rms typ. (measured at 10 Hz rep rate)
- **Bearing**: Sapphire jewel bearing
- **Blade position**: Closed-loop (PID) controlled. Can be operated as NO or NC.
- **Opening/closing bounce**: None allowed
- **Operating temperature**: 0°C to 35°C
- **Mounting**: Any orientation

**General**
- **Max. cable length**: 3 m
- **Weight**: 1 lbs.
- **Dimensions**: 2.25" × 1.6" × 1.0" (WHD)
- **Power**: 4.5 VDC @ 250 mA
- **12 VDC @ 1.25 A

**SR470 Controller**

**Timing**
- **Resolution**: 100 µs (8-digit display)
- **Accuracy**: 100 ppm
- **Pre-exposure delay**: 0 to 10,000 s
- **Exposure time**: 4 ms to 10,000 s (shutter limited)
- **Post-exposure delay**: 4 ms to 10,000 s (shutter limited)
- **Repetition rate**: Shutter limited
- **Initial state**: Normally open or closed (user defined)
- **Shutter type**: SR470 Series Laser Shutters

**Triggering**
- **Modes**: Internal, external TTL, external level, and front-panel, continuous
- **Triggereed burst**: 1 to 99,999,999 timing cycles

**System Fault and Alarms**
- **Alarm types**: Fault LED indicator, audible alarm and rear-panel TTL output. System automatically detects shutter fault.

**Display**
- **Type**: 7-segment LED, 8-digit

### SR474 Four-Channel Driver

**Operation**
- **Shutter type**: SR470 Series Laser Shutters
- **Shutter state**: Shutter state can be controlled manually from front-panel or from external TTL timing signals.
- **Channel enable**: Front-panel **Enable** buttons enable or disable each channel.
- **Global control**: Sets or resets all channels to their “Normal” states.
- **Shutter alignment**: Front-panel **Align** buttons cause selected channels to change state at a 1 Hz rate for easy laser alignment.

**Triggering**
- **Modes**: Front-panel **Source** button selects external TTL, manual or remote (computer interface) state control.

**System Fault and Alarms**
- **Alarm types**: Fault LED indicators, audible alarm and rear-panel TTL output. System automatically detects shutter fault.

**General**
- **Display blanking**: Front panel LEDs can be disabled.

### About the Shutter Heads

Unlike conventional designs, the SR475 Shutter Head can be mounted on your optical table in any orientation. This gives you complete flexibility to route the mating cable out of the way of your experiment.

The aperture is positioned very close to the chassis edge, making the SR475 ideal for chopping one of two parallel beams separated by less than a centimeter. It also allows you to operate your lasers very close to the plane of your optical table top.

The small size of the shutter heads make them ideal in tight quarters, and with a precision guided blade, shutter vibration is essentially eliminated.

### Ordering Information

- **SR470** Shutter controller $1595
- **SR474** 4-ch. shutter driver $1595
- **O470RMS** Single rack mount kit for SR47X $100
- **O470RMD** Double rack mount kit for SR47X $100
- **SR475** Shutter head (100 Hz) $750
